

### Network Stickies Testing

Automated unit tests were written, on both the client and server side, to test the more data-driven parts of the application. The server uses Python's unittest module which comes with the default installation. The client uses JsTestDriver, an open-source JavaScript testing framework that does not require writing a HTML file for test code and can be run from the command line. These tests are relatively brief; Network Stickies does not do heavy data processing, it only reads input from the client, displays it, and saves it.

The automated tests ensured that the pages on the site load properly on the server side, and also that Notes are updated properly on the client side. To test the user interface and the overall experience, I used manual testing as a computer program can't easily tell if a user interface is designed well. I did end-to-end tests manually by making an account, and editing notes under that account.
